Speech recognition is a technology that converts human speech into text. It involves multiple steps such as audio signal acquisition, preprocessing, feature extraction, acoustic model matching, and application of language models. The main goal is to convert continuous speech signals into discrete, meaningful text sequences. Natural language processing is a technology that understands, analyzes, and generates natural language text. It covers text classification, named entity recognition, relationship extraction, sentiment analysis, machine translation, question-answering systems, dialogue systems, and other aspects. Speech recognition and natural language processing each play an important role in the field of artificial intelligence, and support and develop each other.
