The global Spent Fuel Recycling and Storage Services market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Spent fuel refers to the part of nuclear fuel discharged from the pressure vessel of a nuclear power plant after a cycle of use. It contains unburned uranium-235 and newly generated fissile material plutonium-239, as well as fission products such as strontium-90, cesium-137, and technetium-99. Although the nuclear reaction can no longer be maintained due to the reduction of uranium content, it still has a large amount of decay heat and radioactivity. All nuclear power plant reactors will produce spent fuel. With the development of nuclear power, more and more spent fuel will inevitably be produced. Countries around the world have the following three strategies for spent fuel management: reprocessing; deep geological direct disposal; intermediate storage. Regardless of the plan, spent fuel needs to be stored. The International Atomic Energy Agency (IAEA) has also proposed in its many publications that spent fuel storage is an important stage in the nuclear fuel cycle.

United States market for Spent Fuel Recycling and Storage Services is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
