Spherical alumina, also known as sand alumina, alpha alumina, is an alumina material with small specific surface area and good fluidity obtained by processing specific irregular angular particle raw materials into spheres by flame method or high temperature melt blowing method and other methods. Spherical alumina has the characteristics of high thermal conductivity, high insulation, high hardness, high temperature resistance, corrosion resistance, wear resistance, etc. In the crystal lattice of α -type alumina, cations are closely packed in hexagons, and Al^{3+} is symmetrically distributed in oxygen ions. The octahedral coordination center has a large lattice energy, a high melting point and a high boiling power.
