A spherical crown densitometer is a device used to measure the density and thickness of sheet materials such as paper, plastic, or metal. It consists of a spherical weight with a known mass that is placed on top of the material being tested. The weight presses down on the material, causing it to deform slightly. The amount of deformation is measured and used to calculate the material's density. The densitometer's spherical shape allows for even pressure distribution across the material being tested, which produces accurate measurements. The device is often used in industries such as paper

manufacturing, plastic film production, and metal sheet fabrication to ensure consistent quality and uniformity in the materials being produced.
