Abstracts

The global Sphingomyelin market size is predicted to grow from US$ 27.04 million in 2025 to US$ 36.14 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

In 2024, global sphingomyelin production reached 137.5 kg, with an average selling price of $193 per gram.

Sphingomyelin is a specific subtype of sphingomyelin found in neural tissue. Its chemical structure is based on a sphingosine backbone, which is bound to very long-chain fatty acids via amide bonds to form ceramides. This is then linked to the polar head of phosphorylcholine via phospholipid bonds, forming an amphiphilic molecular structure. As the core phospholipid component of the myelin sheath, sphingomyelin accounts for a significant proportion of the central and peripheral nervous systems. Its highly saturated fatty acid chains impart high membrane stability and low permeability, which are crucial for efficient conduction of nerve impulses and axonal insulation.

The sphingomyelin industry chain encompasses three major links: upstream raw material supply, midstream processing and manufacturing, and downstream applications. Upstream raw materials primarily come from animal tissues (such as bovine brain and egg yolk) and plant-based resources (soybeans and sunflowers), produced through biofermentation or chemical synthesis. Representative suppliers include Guangzhou Aichun Pharmaceutical and Alfa Chemistry, Shanghai Zhenzhun Biotechnology and Sigma-Aldrich, among others. Animal-derived raw materials are irreplaceable in neurobiology research due to their rich content of sphingosine phospholipids, while plant-based raw materials have become the mainstream choice in the food and health care product fields due to their sustainability. The midstream segment focuses on innovations in extraction, purification and synthesis technologies. Companies such as Shanghai Yuanye Biotechnology and Beijing Bailingwei Technology

use advanced processes such as chloroform/methanol mixed solvents to improve purity and stability, and use nanotechnology to prepare phospholipid carriers to enhance drug targeting. Brands such as Larodan have become benchmarks in scientific research and industry with their high-purity lipid reagents (such as 98% pure sphingomyelin). Downstream applications cover a wide range of industries including medicine (treatment of neurological diseases, drug carriers), health care products (utilizing moisturizing and antioxidant properties), cosmetics (anti-aging product development) and the food industry (as emulsifiers and nutritional enhancers for infant formula, etc.). Representative companies include Cargill, Avril, Croda, etc.
