The global Spin-on Carbon (SOC) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Spin-on Carbon (SOC) is a material used in semiconductor manufacturing, particularly during the photolithography and etching processes. It is applied as a thin film on semiconductor wafers to act as a hard mask or sacrificial layer during the etching of intricate patterns. SOC is applied in liquid form through a spin-coating process, which evenly distributes the material across the wafer surface. Once applied, the SOC layer is hardened through a baking process, creating a carbon-based protective layer that can withstand the etching of underlying layers such as silicon or oxides. This allows for the precise pattern transfer required in the production of semiconductor devices with advanced node sizes. SOC is widely used in processes that involve deep etching or complex multi-layer structures, providing high etch resistance and process control.

United States market for Spin-on Carbon (SOC) is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
