Spiral blade clarifier is a type of water treatment equipment used for the separation and removal of suspended solids and particles from liquids. It is commonly used in wastewater treatment plants and industrial processes where the removal of solids is necessary for water clarification.

The spiral blade clarifier consists of a circular tank with a central influent pipe and a rotating spiral blade mechanism. When water enters the clarifier, the spiral blade slowly rotates, creating a flow pattern that promotes settling of the suspended solids. The settled solids collect at the bottom of the tank and are periodically removed as sludge. The clarified water then exits the clarifier through peripheral weirs.
