The global Spirometry Machine market size is predicted to grow from US\$ 954 million in 2025 to US\$ 1480 million in 2032; it is expected to grow at a CAGR of 6.6% from 2026 to 2032.

Spirometry Machine is a medical device used to measure lung function. It is a type of pulmonary function test (PFT) that measures the amount and speed of air that a person can inhale and exhale. The electronic spirometer is designed to measure both the volume and flow of air in and out of the lungs, and it provides an objective measure of lung function. Electronic spirometry is commonly used to diagnose and monitor lung diseases such as asthma, chronic obstructive pulmonary disease (COPD), and cystic fibrosis. It is also used to evaluate the effects of medication and other treatments on lung function, and to assess the severity of lung disease. Electronic spirometers are preferred over traditional spirometers, as they offer greater accuracy, reproducibility, and ease of use. They are widely available in hospitals, clinics, and can be used by healthcare professionals or trained patients at home.

The spirometer market is being driven by various factors, including the increasing prevalence of respiratory diseases such as asthma and chronic obstructive pulmonary disease (COPD), the growing awareness about the importance of early diagnosis and monitoring of lung function, and the technological advancements in electronic spirometry devices. Additionally, the rising geriatric population and the consequent increase in the number of patients suffering from respiratory disorders are expected to further drive the market growth. Despite the growth prospects, the electronic spirometer market faces certain limitations that may impede its growth in the coming years. One of the major challenges is the high cost of electronic spirometry devices, which makes them unaffordable for many patients, particularly in developing economies. Moreover, the lack of trained professionals who can operate and interpret spirometry tests accurately poses a significant challenge to the widespread adoption of electronic

spirometry devices. Additionally, the availability of alternative diagnostic tools, such as peak flow meters and handheld spirometry devices, may also hinder the market growth to some extent. Lastly, concerns related to data privacy and security may also pose a challenge to the adoption of electronic spirometry devices, particularly in regions with strict data protection regulations.
