The global Split System Hot Water Heat Pump market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Split System Hot Water Heat Pumps use a refrigeration cycle to extract heat from the surrounding air. They then use a heat exchanger to heat water in an insulated storage cylinder. These systems typically use around 60 to 75% less electricity than a conventional electric hot water system. This is because the electricity is used to operate the heat pump and doesn't heat the water directly with an element. In split systems, the evaporator, fan and compressor are located in a separate unit and connected to the storage cylinder by refrigerant piping – the heated refrigerant gas passes through a heat exchanger located inside the cylinder to heat the water. They're quite similar to a split system air conditioner.

United States market for Split System Hot Water Heat Pump is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
