The global Split Type Ultrasonic Processor market size is predicted to grow from US$ 2812 million in 2025 to US$ 6839 million in 2032; it is expected to grow at a CAGR of 13.8% from 2026 to 2032.

The split-type ultrasonic processor is an ultrasonic treatment device that employs a separated design for the ultrasonic generation unit and the transducer assembly. The ultrasonic generation unit, acting as the core for energy supply and control, is responsible for producing electrical signals of specific frequencies and power levels. The transducer assembly converts these electrical signals into mechanical vibrational energy efficiently through the piezoelectric effect and delivers the ultrasonic energy to the treatment medium via an adapted probe. This split structure allows flexible placement of the generation unit and transducer, accommodating diverse experimental space requirements while facilitating maintenance and upgrades. By precisely adjusting ultrasonic parameters (such as frequency, power, and treatment time), the split-type ultrasonic processor can achieve various functions, including sample dispersion, emulsification, extraction, and fragmentation. It finds extensive applications in fields such as materials science, biomedicine, and chemical engineering, providing an efficient and flexible technical means for ultrasonic treatment of complex systems.
