Milk powder is a dry milk mass that is produced by using drum or spray drying to remove water from the milk. Using classic spray drying, concentrated milk is sprayed into the spray tower as a fine mist against the flow of hot air. This method requires a lot of energy and leads to the loss of valuable materials.

Fresh milk was pasteurized and concentrated by evaporation in vacuo. We then dry the concentrated whole milk by atomization, which is a drying method that converts liquid milk into a powder. Also known as dry 'spray.' Once the milk is concentrated, fine droplets are sprayed from the top of the drying tower, and the air stream heated to 150 °C immediately evaporates the remaining water in the concentrated milk. The obtained powder is then driven into a bag filter that separates the air from the powder prior to packaging the air in a bag or sack.
