Spray Sun Care work by either absorbing or reflecting the UV rays from the sun, preventing them from penetrating into the deeper layers of the skin. It helps to reduce the risk of sunburn, premature skin aging, and the development of skin cancer. There are two types of UV rays: UVA and UVB. UVA rays can penetrate deeper into the skin and are associated with skin aging, while UVB rays primarily affect the outer layers of the skin and are responsible for sunburn. It is important to choose a broad-spectrum sun cream that offers protection against both UVA and UVB rays. Sun creams are available in different strengths, known as sun protection factor (SPF). The SPF rating indicates the level of protection the sun cream provides against UVB rays. Higher SPF ratings offer more protection, but it is important to note that no sun cream can provide 100% protection from the sun's rays. It is recommended to choose a sun cream with at least SPF 30 and to reapply it every two hours while exposed to the sun.
