Spring Brake Cylinder is a device used in the vehicle braking system, which utilizes the force of the spring to achieve braking. When compressed air enters the brake cylinder, it overcomes the braking force of the spring, putting the brake in the released state. When the pressure of the compressed air drops or is lost, the elastic force of the spring will push the brake piston, thereby achieving braking. This device is often used in the pneumatic braking system of commercial vehicles to ensure that the vehicle can brake safely in emergency situations or when parked.
