The global Spring-Loaded Electromagnetic Brake market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The spring-loaded electromagnetic brake is a dry friction brake that uses spring force and electromagnetic force to brake and release. Its working principle is: when the power is off, the spring force causes friction between the brake disc and the rotor, thereby braking the shaft; when the power is on, the electromagnetic force overcomes the spring force, causing the brake disc and rotor to disengage, thereby releasing the shaft. . Spring-loaded electromagnetic brakes have the characteristics of compact structure, stable braking torque, fast response speed and low noise. They are widely used in motors, lifting equipment, packaging machines, automatic doors and other fields.
