## Abstracts

The global Spring Recycling and Remanufacturing Services market size is predicted to grow from US\$ 6368 million in 2025 to US\$ 11760 million in 2032; it is expected to grow at a CAGR of 9.3% from 2026 to 2032.

Spring recycling and remanufacturing services are a professional circular economy solution focused on the systematic processing of scrapped or used springs and spring assemblies from the automotive, industrial equipment, and energy sectors. The service encompasses two core aspects: First, recycling ? environmentally friendly recycling of springs that cannot or do not require remanufacturing, reintroducing their metal materials into the raw material recycling system. Second, remanufacturing ? for core spring components with remanufacturing value, a rigorous industrial process (disassembly-cleaning-inspection-repair/strengthening-assembly-testing) is followed to restore them to the performance specifications of the original equipment manufacturer (OEM), equivalent to the quality and warranty of new products. The upstream supply chain mainly includes suppliers of scrapped springs, such as automotive dismantling plants, industrial equipment maintenance providers, machinery manufacturing plants, and scrap metal recycling networks, who provide the core raw material ? used springs. The downstream supply chain is the output channel for the remanufactured finished products, primarily flowing to end users who require cost-effective spare parts, including the automotive aftermarket (repair shops, fleets), OEM after-sales service systems, various industrial equipment users, and dealer and distributor networks. The demand fundamentally stems from customers' dual pursuit of cost reduction, efficiency improvement, and sustainable development. Specifically, this manifests as companies seeking to reduce new component procurement and inventory costs, minimize equipment downtime, and simultaneously meet increasingly stringent environmental

regulations, reduce their carbon footprint, and achieve their ESG (Environmental, Social, and Governance) goals. In 2025, the average selling price for spring recycling and remanufacturing services was approximately \$200 per spring, with a gross profit margin of approximately 40%.

The core market drivers for spring recycling and remanufacturing services are rooted in the synergistic pursuit of economic benefits and environmental responsibility by enterprises. Firstly, cost reduction and efficiency improvement are the most direct driving forces for enterprises. Compared to purchasing new springs, remanufactured parts can significantly reduce spare parts costs and inventory capital, providing customers with cost-effective alternatives and effectively reducing losses caused by equipment downtime. Secondly, the rigid constraints of sustainable development are rapidly emerging as a key driving force. Increasingly stringent environmental regulations globally and ESG targets set by enterprises themselves are forcing the manufacturing industry to reduce its carbon footprint. Spring recycling and remanufacturing, by reintroducing waste materials into the circular system, has become an important path to achieving green manufacturing and efficient resource utilization. Furthermore, the scale effect of the existing market provides a vast fertile ground for services. The large number of vehicles in the automotive and industrial equipment sectors generates massive maintenance and replacement demand, bringing a continuous and stable market space for remanufacturing services.
