Square Type Counter-Flow Closed Cooling Towers is a circulation system that avoids water pollution caused by direct contact between external circulating water and air. This system uses automatic frequency conversion control, which can save electricity and water resources to a great extent. The circulating water enters the heat exchanger (also known as the closed cooling tower coil) after being heated by the heat source. Through the heat exchanger tube, the heat is sent to the outside, and the cooled circulating water is sent to the heat source by the system circulating water pump. The spray water is sent from the lower water tank to the upper water distribution pipe by the diffuser water pump. After the water is sprayed out, it contacts the heat exchanger tube, and part of the water evaporates and takes away the heat. The cooled spray water falls into the lower water tank and circulates again.

The global Square Type Counter-Flow Closed Cooling Towers market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
