The global SR Latch market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

The SR latch is a basic digital circuit element used to store the state of a bit (bit), its input includes two control signals S (Set, set to 1) and R (Reset, set to 0), and the output There are two output ports of Q and Q', where Q is the state of the output, and Q' is the complement of Q. The state of the SR latch can be changed by controlling the state of the input signal, so it can be used to store the state of a digital signal and maintain the state of the output when required. The state of the SR latch can be controlled with two inverting control inputs. When S=1, R=0, the output Q=1, Q'=0, which is called the set state (Set), that is, the state of the SR latch is '1'. When S=0, R=1, output Q=0, Q'=1, which is called reset state (Reset), that is, the state of the SR latch is '0'. When S=0, R=0, the output state of the SR latch is uncertain, which is called the forbidden state (Forbidden). When S=1, R=1, the state of the SR latch is invalid, that is, a state that should not appear, also known as a prohibited state. An SR latch usually consists of two cross-coupled gates, such as two cross-coupled NOR gates or two cross-coupled NAND gates, so it is also called a flip-flop. Since the SR latch has bistable characteristics, it can be used to realize various digital circuit elements, such as counters, registers, memories, etc.

United States market for SR Latch is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for SR Latch is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

Europe market for SR Latch is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
