The global SRAM Controller Units market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A SRAM Controller Unit is a specialized integrated circuit (IC) designed to manage the operation of static random access memory (SRAM) modules. It acts as an interface between the host system (e.g., CPU, microcontroller) and the SRAM, translating memory access requests into control signals that drive the SRAM's internal circuitry.

Key functions of a SRAM Controller Unit:

**Address decoding:** Translates memory addresses from the host system into row and column select signals for the SRAM.

**Data buffering:** Temporarily stores data being transferred between the host system and the SRAM.

**Error detection and correction:** Implements parity or ECC (error-correcting code) mechanisms to ensure data integrity.

**Timing control:** Synchronizes memory access operations with the host system's clock.

**Power management:** Controls the power supply to the SRAM to optimize performance and energy efficiency.

United States market for SRAM Controller Units is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
