Firmware is software solidified in hardware, similar to a computer's operating system. The firmware is installed on a small memory chip of the hard disk, which is used to guide the hard disk to work, and it is responsible for the most basic and bottom-level work of the system. In the solid-state hard disk, the firmware is responsible for driving, controlling, decoding, transmitting, testing, etc., such as managing the storage location of data, recording damaged defective sectors, avoiding the use of these bad defective sectors again, recording The temperature or errors of the hard disk during work.
