Aluminium foam is a material made of Aluminium, which is also populated with a large volume of pores or cavities. It is a solid material filled with pores such that up to 95% of the volume consists of gas-filled voids, in two different kinds of structures. Depending on the density, appearance of the structure, shapes of cavities and method of manufacture, these are known as Stochastic or Reticulated Foams and Regular Stacked Cell Foams. The pores can be sealed from each other (known as closed-cell foams) or can form an interconnected network (open-cell foams). The injection of gas, whether by physical or chemical means, is broadly responsible for creating the pores or cavities within Aluminium foam.

The global market for Stabilized Aluminum Foam (SAF) is estimated to increase from US\$ million in 2021 to reach US\$ million by 2028, exhibiting a CAGR of % during 2022-2028.
