The global Stainless Steel Powder Sintered Filter Disc market size is predicted to grow from US$ 311 million in 2025 to US$ 417 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

A stainless steel powder sintered filter disc is a filtration device fabricated through a sintering process using stainless steel powder as the raw material. The stainless steel powder is first compacted into the shape of a disc, and then subjected to a high-temperature sintering operation. During sintering, the powder particles bond together, forming a porous structure within the disc. This porous structure allows for the passage of fluids (such as liquids or gases) while retaining solid particles. The stainless steel material imparts excellent corrosion resistance, high strength, and durability to the filter disc. It is designed to withstand various operating conditions, including exposure to corrosive chemicals, high temperatures, and high pressures. These filter discs are widely used in industries such as chemical processing, food and beverage, water treatment, and pharmaceuticals, where precise filtration of fluids to remove impurities and maintain product quality is essential. The pore size and porosity of the stainless steel powder sintered filter disc can be carefully controlled during the manufacturing process to meet specific filtration requirements, ensuring efficient separation of solid contaminants from the fluid stream.
