The global Stainless Steel Sintered Mesh market size is predicted to grow from US\$ 479 million in 2025 to US\$ 706 million in 2032; it is expected to grow at a CAGR of 5.7% from 2026 to 2032.

Stainless steel sintered mesh is a rigid porous metal filter material made by using 304, 304L, 316, 316L and other stainless steel woven wire mesh as the substrate, stacking the filter layer, protective layer, dispersion layer and support layer, and then pressing, vacuum sintering or diffusion bonding. Its core feature is the stable bonding of multi-layer wire mesh at the contact point, which enables the material to have fixed aperture, high mechanical strength, pressure resistance, high temperature resistance, corrosion resistance, backwashability, and repeatable cleaning properties. The standard five layer stainless steel sintered mesh is usually made by vacuum diffusion sintering five layers of metal woven mesh with different pore sizes and wire diameters, which can balance accuracy, strength, and air and liquid permeability. In 2025, global Stainless Steel Sintered Mesh production reached approximately 11.86 M Sq m, with an average global market price of around US\$ 41.30 per Sq m. The annual production capacity of stainless steel sintered mesh is 15 M Sq m, with a gross profit margin of about 30%.

The upstream mainly includes 304 stainless steel wire, 304L stainless steel wire, 316 stainless steel wire, 316L stainless steel wire, stainless steel woven mesh, dense mesh, protective mesh, support mesh, punching plate, vacuum sintering furnace, diffusion welding equipment, flattening equipment, laser cutting equipment, plasma cutting equipment, welding equipment, cleaning and passivation materials, and clean packaging materials.

The downstream mainly includes chemical filtration, petrochemical filtration, polymer

melt filtration, pharmaceutical filtration, food and beverage filtration, hydraulic systems, oil and gas filtration, water treatment, high-temperature gas filtration, catalyst recovery, environmental dust removal, electronic chemicals, and industrial automation equipment. This material is suitable for high temperature, high pressure difference, corrosive media, and scenarios that require cleaning and regeneration. Typical advantages include stable pore size, high strength, low pressure difference, corrosion resistance, high temperature resistance, and backwashability; Multilayer sintered mesh can also be processed into forms such as filters, filter plates, filter cartridges, filter cartridges, and conical components.

Stainless steel wire mesh and punched plate substrates account for about 48% to 63%, multi-layer mesh cutting, stacking, positioning, and pre pressing account for about 7% to 12%, vacuum sintering, diffusion bonding, and heat treatment account for about 10% to 16%, flattening, shaping, cutting, welding, and post filter processing account for about 6% to 11%, cleaning, passivation, aperture detection, bubble point testing, and strength testing account for about 4% to 8%, labor, energy, and equipment depreciation account for about 5% to 9%, packaging, storage, and transportation account for about 2% to 5%, yield loss and rework account for about 3% to 6%.

Stainless steel sintered mesh is an important sub product in high-end industrial filtration materials, mainly used in chemical, petrochemical, polymer melt filtration, pharmaceuticals, food and beverage, hydraulic systems, oil and gas, aerospace, high-temperature gas filtration, water treatment, catalyst recovery, and environmental dust removal fields. Compared to ordinary stainless steel woven mesh, its advantages lie in stable pore size, high structural strength, customizable filtration accuracy, high pressure resistance, washable regeneration, and long service life. Therefore, it is more suitable for continuous production, high-value media filtration, and working conditions that require repeated cleaning. The future market opportunities will mainly focus on polymer melt filtration, lithium battery and chemical new material filtration, electronic chemical filtration, pharmaceutical clean filtration, high-temperature corrosive gas filtration, import substitution, and backwashable long-life filter cartridges; Industry challenges include fluctuations in stainless steel wire prices, consistency in vacuum sintering, requirements for pore size and bubble point detection, post weld processing yield, long customer certification cycles, and competition for substitute sintered powder filter materials, metal fiber felt, and ceramic filter materials in some scenarios. Overall, stainless steel sintered mesh will still maintain its positioning as a "high-end filter material with renewable filter material". Enterprises with stable sintering processes, precision testing, special alloy processing, and downstream filter design capabilities are more likely to obtain mid to high end orders.
