Standalone Partial Discharge Detector is a specialized device used to detect the partial discharge phenomenon inside electrical equipment such as transformers, switchgear, cables, etc. It can capture the electromagnetic waves, sound waves or light signals generated by discharge through highly sensitive sensors while the equipment is in operation. After analysis by the built-in signal processing system, it can achieve quantitative assessment of partial discharge activities. This type of detector usually has the ability to work independently, does not rely on external power supply or control systems, is easy to operate, and can promptly detect insulation defects and potential faults inside the equipment. It is widely used in power systems, industrial production, and electrical equipment manufacturing fields, and is of great significance for ensuring the reliable operation of electrical equipment and preventing faults.

United States market for Standalone Partial Discharge Detector is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
