A standalone smoke detector is a device designed to detect smoke in the air and emit an alarm when smoke is detected. Unlike networked smoke detectors, standalone smoke detectors operate independently and do not require connection to other systems, hence the term 'standalone.' They typically consist of a smoke sensor, alarm, and power source, and can be installed in various areas of a building such as bedrooms, hallways, and stairwells. When a standalone smoke detector detects smoke, the alarm sounds, alerting people to the potential risk of fire so they can take prompt evacuation and fire suppression measures. These detectors are widely used in homes, commercial buildings, and public spaces, serving as a crucial component of fire safety systems.

The global Standalone Smoke Detector market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
