Standard copper foil is mainly used for pressing paper-based phenolic resin copper-clad laminates and epoxy glass fibre cloth copper-clad panels (represented by ordinary FR-4 panels), for copper foil used in paper-based copper-clad panels, in order to improve the bonding strength of the copper foil and the substrate, after the copper foil is roughened and treated, a layer of special adhesive is also applied, the roughness of the roughened surface of this copper foil is relatively large, the thickness of the copper foil is generally 18 to 70 μm , and the various performance requirements Not very high. For the copper foil used for glass fibre cladding, in addition to the necessary roughening treatment, it is also subjected to heat-resistant treatment (e.g. alloying with nickel, cobalt, zinc, etc.), special high-temperature anti-oxidation treatment, with a high bonding strength to the base material and a heat-resistant temperature of around 200°C. It has 18 μm copper foil as its main body.
