Standard RAID mode hard disk array is a data storage technology that combines multiple independent hard disk drives (HDDs) or solid-state drives (SSDs) into a logical unit to provide data redundancy, increase performance, or both. RAID technology stores data on multiple hard disks through specific algorithms and configuration methods to achieve data reliability, availability and performance optimization. Standard RAID mode hard disk arrays are usually defined according to the RAID level used. Different RAID levels provide different balances between data protection, performance, and cost-effectiveness. The definition of standard RAID mode hard disk arrays covers these different RAID levels and their implementation methods, which together form the core of RAID technology. By selecting the appropriate RAID level and configuration method, the performance, reliability, and cost-effectiveness of the storage system can be optimized according to specific application requirements.

The global Standard RAID Mode Hard Disk Array market size is projected to grow from US\$ 18750 million in 2024 to US\$ 25080 million in 2030; it is expected to grow at a CAGR of 5.0% from 2024 to 2030.
