A star tracker is an optical device used in spacecraft to determine its orientation by observing the positions of stars. It consists of a camera and a processing unit that captures images of the star field and compares them to an onboard star catalog to identify known stars. By calculating the relative positions of these stars, the star tracker can determine the spacecraft's precise attitude or orientation in space. This information is crucial for navigation, control, and stabilization of the spacecraft, ensuring accurate pointing of instruments and antennas. Star trackers are widely used in satellites, space probes, and telescopes for their high precision and reliability in the challenging environment of space.

The global Star Tracker market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
