Staring Hyperspectral Imaging Camera is an imaging device based on liquid crystal tunable filter (LCTF), which can capture images in multiple spectral bands at the same time. Unlike ordinary cameras that can only capture visible light, hyperspectral cameras can capture spectral information from visible light to near infrared and even short-wave infrared.

Staring Hyperspectral Imaging Camera uses liquid crystal tunable filter (LCTF) to continuously subdivide narrow bands and perform high-resolution two-dimensional array imaging of each band. Specifically, LCTF can select specific wavelengths by electronic control, thereby achieving accurate imaging of different bands. Through image processing, a complete hyperspectral image sequence is finally obtained.

United States market for Staring Hyperspectral Imaging Camera is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
