The global Start-Stop Power Supply market size is predicted to grow from US\$ 4708 million in 2025 to US\$ 8251 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

The start-stop power supply is a power solution designed specifically to meet the start-stop system of the car. Its core function is to provide stable and reliable power support for the vehicle during the start-stop process, ensuring that other electronic devices can work normally when the engine starts and stops frequently. With the increasingly stringent environmental regulations and the development of electrification in the automotive industry, the start-stop power supply has gradually become an indispensable and important part of modern cars.

As an intelligent power supply product with remote control function, the start-stop power supply is rapidly popularizing with the development of industries such as industrial automation, intelligent manufacturing, new energy systems, communication equipment and rail transportation. It has the characteristics of remote start-stop, programmable control, digital bus communication (such as PMBus, CAN, Modbus, etc.), which can significantly improve the system integration efficiency and operation and maintenance convenience, and become the key support unit for the "software and hardware integration" of intelligent devices. The current market shows two significant trends: first, the demand for small and medium power segments continues to grow, especially in industrial control, communication power supply, and security systems. The second is that the mid-to-high-end market has a strong demand for intelligent and remotely monitored power modules, which drives the development of programmable, bus communication, and multi-channel output power supplies.
