A polarimeter is an instrument used to measure the polarization state of light. It can decompose the polarization state of light into polarization components in different directions, and measure their amplitude, phase and other parameters. The polarization state measuring instrument usually consists of polarization beam splitter, wave plate, optical filter, photodetector and other components. During measurement, the light to be measured first passes through a polarization beam splitter and is split into two beams

with different polarization directions, then passes through a wave plate and a filter for analysis, and finally is received by a photodetector for signal processing. The polarization state measuring instrument is widely used in optical communication, optical microscope, laser processing, optical sensing and other fields.
