Static balance valve, also known as balance valve, manual balance valve, digital locking balance valve, two position regulating valve, etc., changes the flow resistance flowing through the valve by changing the gap (opening) between the valve core and the valve seat, so as to achieve the purpose of regulating the flow. Its function object is the resistance of the system. The static balance valve can balance and distribute the new water according to the proportion calculated in the design, All branches behind the valve increase or decrease proportionally at the same time, which still meets the flow demand of partial load under the current climate needs and plays the role of heat balance.
