The global Static CT Scanners market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A static CT scanner is a type of computed tomography (CT) imaging device that captures cross-sectional images using X-rays without the need for rotating components. Unlike conventional CT scanners, which rotate around the patient to acquire images, static CT scanners use stationary detectors arranged in an arc or a ring to capture multiple images simultaneously. This design allows for faster image acquisition and reduces the need for patient movement, which is particularly beneficial in emergency medical situations and for patients who cannot remain still, such as children. Static CT scanners are also employed in security applications, such as scanning luggage and cargo at airports, due to their ability to provide high-resolution, three-dimensional images rapidly. This capability enhances the detection of concealed items or threats, making static CT scanners a versatile tool in both medical diagnostics and security inspections.

United States market for Static CT Scanners is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
