The stator housing, also known as the stator frame or stator frame assembly, is a component of an electric motor that encloses and supports the stator. The stator is the stationary part of the motor that contains the windings responsible for generating a magnetic field. The stator housing provides mechanical protection and structural support to the stator assembly. It is typically made of durable materials such as metal or plastic and is designed to withstand the forces and vibrations associated with motor operation. The stator housing also helps to preserve the integrity of the stator windings by preventing contaminants from entering and damaging the insulation. In addition to its protective function, the stator housing may also have cooling features such as fins or channels to enhance heat dissipation from the stator assembly. Some motors may also have bearings or mountings integrated into the stator housing to facilitate the motor's

installation and connection with other components or systems.
