A steam iron uses superheated water to eliminate wrinkles in clothes and fabrics which may not be suitable for traditional dry ironing. Distilled water is usually poured into a holding tank and special heating elements convert it to steam. Steam irons have a steam output and steam holes. Some have a steam output made up of hundreds of tiny holes which gives out a great amount of steam. This hot mist comes out through a number of holes in the soleplate (bottom heating element) of the iron. As the steam loosens the individual fibers of the clothes, the steam iron's pressing action smooths out wrinkles.
