The steam milk frother heats the milk by injecting steam and produces foam, thereby making delicate milk foam. This device usually consists of a heating base, a milk cup, a milk frothing rod (also called a steam wand or steam nozzle) and a control panel. During operation, the milk is poured into the milk cup, and then the milk cup is placed on the heating base of the steam milk frother. Then, turn on the machine, and the steam milk frother will inject steam into the milk through the milk frother rod, while stirring it, so that the protein and sugar in the milk capture the air and form rich milk foam. Steam milk frothers are widely used in homes, cafes, tea shops and other places. In homes, it can provide coffee lovers with a high-quality milk foam making experience; in cafes and tea shops, it is one of the essential tools for making classic coffee drinks such as cappuccino and latte.
