The global Steam Operated Lithium Bromide Absorption Chiller market size is predicted to grow from US\$ 3362 million in 2025 to US\$ 5304 million in 2032; it is expected to grow at a CAGR of 6.8% from 2026 to 2032.

In 2025, global Steam Operated Lithium Bromide Absorption Chiller production reached approximately 14.3k units, with an average global market price of around US\$240k per unit.

A Steam Operated Lithium Bromide Absorption Chiller is an absorption cooling unit that uses steam as the driving heat source, water as the refrigerant, and lithium bromide solution as the absorbent. Steam heats the generator, causing the lithium bromide solution to release water vapor, which is then condensed, throttled, and evaporated to absorb heat from chilled water and produce cooling. Unlike electric compression chillers, this system requires much less electrical power and is well suited for facilities with stable steam or waste heat resources, such as industrial parks, chemical plants, pharmaceutical factories, textile mills, food processing plants, hospitals, and district energy systems.

The upstream segment of steam operated lithium bromide absorption chillers includes suppliers of lithium bromide solution, copper tubes, stainless-steel plates, heat exchangers, vacuum pumps, valves, control systems, and automation components, with representative suppliers including Albemarle, LANXESS, Wieland, Sandvik, Siemens, Danfoss, and Honeywell. Midstream manufacturers include Broad Air Conditioning, Shuangliang Eco-Energy, Ebara, Yazaki, Carrier, and Johnson Controls. Downstream applications are mainly found in industrial waste heat recovery, district cooling, chemicals, pharmaceuticals, food and beverage, textiles, hospitals, and large public

buildings, with representative users including BASF, Dow, Pfizer, Nestl?, Mayo Clinic, and district energy operators. The key value of this equipment lies in converting steam or industrial waste heat into cooling capacity, reducing electricity demand and improving overall energy utilization efficiency.

The steam operated lithium bromide absorption chiller market is mainly driven by industrial waste heat recovery, combined heat and power systems, district energy projects, and energy-saving demand in large public buildings. Compared with electrically driven compression chillers, these units can use steam and low-grade thermal energy for cooling, offering advantages in peak electricity load reduction, cascade energy utilization, and low-carbon operation. Future development is expected to focus on high-efficiency double-effect systems, intelligent controls, improved corrosion management, modular energy stations, and deeper waste heat recovery. However, limited access to stable steam sources, system design complexity, high initial investment, maintenance requirements, and competition from high-efficiency electric chillers remain key market challenges.
