The steel-aluminum composite conductor rail is a conductor rail used in the electric bridge crane system to transmit power and control signals to the crane and trolley of the crane. It is designed to provide a lightweight and durable solution for power

transmission, and also reduce the overall weight of the crane system. The conductor rail is composed of a steel base providing structural strength and an aluminum layer on the surface used as an electrical conductor. The aluminum layer is usually coated with insulating material to prevent corrosion and electric arc. The steel-aluminum composite conductor rail is superior to the traditional all-steel or all-aluminum conductor rail because it combines the advantages of the two materials. The steel substrate provides strength and durability, while the aluminum conductor layer provides low resistance and conductivity. The conductor rail is usually installed in the rail or runway system above the crane working area. The crane and trolley are equipped with collector shoes, which are in contact with the contact rail to transmit power and control signals to the crane.
