The global Steelmaking Slag market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Steelmaking slag is the general term for the product formed by the physical and chemical reaction between the impurities in the metal materials (molten iron and scrap steel, etc.) oxidized by oxidants and the oxides generated by the slag-forming agent and the furnace lining. The density of slag is lower than that of molten steel and it usually covers the surface of molten steel. The main task of steelmaking is to remove harmful impurities (sulfur, phosphorus, gas and inclusions, etc.) in molten steel to the maximum extent, which mainly relies on the refining effect of slag. Therefore, the composition and temperature of slag must be constantly controlled and adjusted during the smelting process.

United States market for Steelmaking Slag is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Steelmaking Slag is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
