The global Steering Wheel Torque Sensor market size is predicted to grow from US$ 69.5 million in 2025 to US$ 99 million in 2031; it is expected to grow at a CAGR of 6.1% from 2025 to 2031.

A steering wheel torque sensor measures the amount of rotational force (torque) applied by the driver to the steering wheel. This sensor is crucial for various automotive systems, including electric power steering (EPS), lane keeping assist (LKA), and automated driving functionalities. By accurately measuring the driver's steering input, the system can provide appropriate steering assistance, maintain lane position, or even control the vehicle autonomously. The sensor typically uses strain gauges or other sensing technologies to convert the mechanical torque into an electrical signal.

The trend for steering wheel torque sensors is closely tied to the advancements in advanced driver-assistance systems (ADAS) and the pursuit of autonomous driving. Several key trends are shaping this market. Firstly, there's a growing demand for higher accuracy and reliability of these sensors. As vehicles become more automated, precise measurement of driver input is crucial for safe and effective operation. Secondly, there's a shift towards more integrated and compact sensor designs. This is driven by the need to reduce weight and complexity in vehicle architectures. Thirdly, the integration of torque sensors with other sensor technologies, such as steering angle sensors and wheel speed sensors, is becoming more common. This sensor fusion provides a more comprehensive understanding of the vehicle's dynamics and driver's intentions. Furthermore, the development of redundant torque sensing systems is gaining traction, especially in the context of highly automated driving. Redundancy ensures that the

system can still function safely even if one sensor fails. Finally, with the rise of steer-by-wire systems (where there is no mechanical connection between the steering wheel and the wheels), the role of torque sensors becomes even more critical, as they become the primary means of measuring driver input. This shift towards steer-by-wire will further accelerate the development and refinement of steering wheel torque sensor technology.
