A stem bending strength tester is an agricultural mechanics testing device used to measure the bending resistance of crop or plant stems under external forces. It primarily assesses the mechanical strength and lodging resistance of stems by applying gradually increasing bending forces or lateral pressures to the stems and determining their critical bending force or breaking force. This device typically consists of a force sensor, a loading mechanism, and a data acquisition system. It can quantitatively test the stems of crops such as corn, wheat, and rice, and is widely used in crop breeding research, agricultural research institutions, and agricultural machinery adaptability evaluation to analyze the structural strength, lodging resistance, and mechanized harvesting adaptability of varieties. Sales in 2025 were projected at 220,000 units, with an average price of \$750. Total production capacity was projected at 300,000 units, with a gross profit margin of 60%. Downstream consumption was estimated at approximately 5 units per medium-sized research institute.
