Stenting and dilation devices are medical instruments used in various medical procedures to open or widen narrowed or blocked passages within the body. These devices are commonly employed in minimally invasive procedures to address conditions such as vascular blockages, strictures, and obstructions in different anatomical structures. The primary purpose of these devices is to restore or improve the flow of fluids (such as blood, bile, or urine) or to facilitate the passage of instruments in a controlled manner.

The trend toward minimally invasive procedures continues to influence the medical field. Stenting and dilation devices are often used in less invasive interventions, contributing to faster recovery times and reduced hospital stays.
