The global Step Index Fiber market size is predicted to grow from US\$ 1171 million in 2025 to US\$ 2278 million in 2032; it is expected to grow at a CAGR of 10.2% from 2026 to 2032.

Step-index fiber is a type of optical fiber with a significant difference in refractive index between the core and the cladding. This structure enables optical signals to propagate efficiently in the fiber. For optical fibers, a step-index profile is a refractive index profile characterized by a uniform refractive index within the core and a sharp drop in the refractive index at the core-cladding interface, leaving the cladding with a lower refractive index. A step-index profile corresponds to a power-law refractive index profile with a profile parameter approaching infinity. Step-index profiles are used in most single-mode fibers and some multimode fibers.

United States market for Step Index Fiber is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
