The global Stereotactic Radiation Therapy (SRT) System market size is predicted to grow from US\$ 350 million in 2025 to US\$ 1541 million in 2032; it is expected to grow at a CAGR of 24.1% from 2026 to 2032.

Improvements in tumor localization, imaging and dosimetry in radiotherapy has allowed for the implementation of hypofractionated radiotherapy for disease sites where conventional fractionation (around 2 Gy per fraction) was previously the norm or where curative radiotherapy was not attempted. SRT comprises high-precision irradiation techniques that use multiple, photon radiation beams to deliver a high dose of radiation. Stereotactic localization, using frame-based or frameless techniques, is used to treat lesions. Regarding dose fractionation, SRT is divided into stereotactic radiosurgery (SRS), in which the total dose is delivered in a single treatment session, and stereotactic radiotherapy, in which the total dose is delivered in multiple fractions (usually less than 8 treatments). Originally this technique was only used when treating lesions located in the brain, however now a number of extra-cranial malignancies are treated using stereotactic localization (stereotactic body radiotherapy (SBRT)).
