Stereotactic radiosurgery involves delivering highly focused beams of radiation to specific targets within the brain. It is a non-surgical procedure that does not involve incisions or tissue removal. Gamma Knife is a specialized device used for stereotactic radiosurgery. It consists of a helmet-like device that houses up to 192 small cobalt-60 radiation sources. These sources emit gamma rays that converge at targeted points within the brain, delivering precise, concentrated doses of radiation. Gamma Knife stereotactic radiosurgery is commonly used to treat benign and malignant brain tumors, arteriovenous malformations (AVMs), trigeminal neuralgia, and other neurological conditions.

The global Stereotaxic Radiosurgery Gamma Knife market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
