The global Sterile Gauze Dressing market size is predicted to grow from US\$ 155 million in 2025 to US\$ 222 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

Sterile Gauze Dressing is a medical supply that consists of one or more layers of sterile, absorbent gauze material, used to cover and protect wounds or injuries. The gauze is typically made from cotton or a similar fibrous material and is packaged in a sterile environment to ensure that it is free from microorganisms and contaminants. This sterile dressing is applied to the wound to absorb blood, fluids, and debris, while also providing a barrier to prevent further infection and promote healing. Sterile gauze dressings are commonly used in a variety of medical and first aid settings for treating cuts, burns, scrapes, and other types of wounds. Upstream: Raw materials such as cotton/viscose fiber, medical-grade bleaching and degreasing agents, packaging materials (medical paper/aluminum-plastic/PE), sterilization consumables (ethylene oxide gas, etc.), and testing consumables. Downstream: Hospital surgery and dressing changes, emergency and primary care, home care, pharmacies/e-commerce channels, elderly care and rehabilitation institutions.

The global unit price of sterile gauze dressings is US\$150 per thousand pieces, with annual sales of approximately 1.058 billion pieces and a global annual production capacity of 1.2 billion pieces. The industry profit margin is 18%.

Global Future Development Trends:

A Greater Emphasis on Compliance and Traceability: Continuous upgrades are being made to sterilization validation, microbial limits, clean production, and batch traceability

systems. Electronic traceability codes, digitized batch records, and routine third-party testing are reducing the risk of hospital-acquired infections and recalls.

Product Forms are Shifting from 'General-Purpose Gauze' to 'Scenario-Specific Combinations': Packaged with tapes, bandages, dressings, and absorbent pads in customized/treatment packages; better suited to different wound types (exudate volume, location, postoperative incision) and nursing procedures, improving efficiency and reducing overall costs.

Changes in Outpatient and Channel Structure: Home dressing changes, chronic disease management, and postoperative follow-up are driving standardized specifications, smaller packaging, and portability; growth in e-commerce and chain pharmacies is promoting branding, user education, and more user-friendly instructions (anti-adhesion, easy-tear packaging, single-use sterile opening).
