Freeze-dried vials can provide a stable and reliable solution for compounds that cannot be stored or transported in liquid or frozen form. Lyophilization is a form of freeze-drying that reduces the air pressure around frozen products by using a vacuum chamber or a freeze-drying machine. Remove water from products such as protein, collagen or peptides, allowing the water to sublimate naturally, while keeping the frozen and dry product intact. Compared with liquid or frozen products, the resulting freeze-dried products usually stored in vials have a longer shelf life, higher stability, and are easier to transport.
