The global Sterile Membrane Filter market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Sterile membrane filter is a microporous membrane device, usually made of polyamide, polyester, polycarbonate and other polymer materials. Its micropore size is usually between 0.1 and 10 microns, which can effectively filter out microorganisms, particles and other contaminants to ensure the purity and safety of the product. Its filtration principle mainly relies on barrier effect and diffusion effect, which can effectively intercept microorganisms, particles and other pollutants and prevent them from entering the membrane through micropores.

Sterile membrane filters are widely used in multiple industries, especially in biopharmaceutical, food and beverage production processes. In the field of biopharmaceuticals, sterile membrane filters are often used in sterilization and virus removal to ensure product purity and safety. In the food and beverage industry, it is used in processes such as clarification, filtration and sterilization to ensure the taste and quality of the product.
