Sterile Service Tracking refers to the process of monitoring and recording the movement, use, and maintenance of sterile equipment, supplies, or services within a healthcare environment. Sterility is a critical aspect in medical settings, as it ensures that surgical instruments, implants, dressings, and other items used on patients are free from microorganisms that could cause infection.

The requirements for hospital infection control have been strengthened, and the tracking of sterile equipment from cleaning, packaging to use has become a mandatory specification.

The construction of digital hospitals has accelerated, promoting the integrated application of tracking technologies such as RFID, barcodes, and blockchain in CSSD (disinfection supply center).

The demand for prevention and control of medical disputes and legal risks has increased, making auditable equipment tracking records an important guarantee for hospital compliance operations.

The popularization of multi-campus operation models has put forward higher systematized management requirements for sterile logistics tracking across institutions and departments.
