The report requires updating with new data and is sent in 48 hours after order is placed.

The global Sterile Wound Closure Strips market size is predicted to grow from US$ 24420 million in 2025 to US$ 37180 million in 2031; it is expected to grow at a CAGR of 7.3% from 2025 to 2031.

Sterile wound closure strips, often referred to as adhesive wound-closure strips or skin closure strips, are thin adhesive strips used to close small wounds or surgical incisions. They are applied across the wound to hold the edges of the skin together, promoting healing without the need for sutures or staples. These strips are sterile to prevent infection and are commonly used in cases where a wound is shallow, clean, and does not require deeper tissue repair.

There is a growing preference for non-invasive and minimally invasive treatments in both surgical and non-surgical wound care. Sterile wound closure strips are seen as an alternative to sutures and staples for minor wounds and lacerations, providing effective closure without puncturing the skin.

Innovative materials are being developed to improve the performance of wound closure strips. Newer products use materials that are hypoallergenic, breathable, waterproof, and flexible. Some advanced versions incorporate antimicrobial agents to reduce infection risks.

There is an increasing shift towards outpatient care and home-based wound management. Sterile wound closure strips are user-friendly and do not require the expertise of a healthcare professional, making them ideal for such settings.
