The global Sterilizing Grade PES Pleated Filter Cartridge market size is predicted to grow from US\$ 346 million in 2025 to US\$ 495 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

The Sterilizing Grade PES Pleated Filter Cartridge is a high-efficiency sterilization device manufactured using a pleated design with a polyethersulfone (PES) microporous membrane as the filtration medium. It primarily employs physical retention to capture impurities—such as bacteria and microorganisms—from liquids or gases. These cartridges are widely used in sectors requiring stringent aseptic environments, including biopharmaceuticals, food and beverage, healthcare, and laboratory research.

Upstream activities focus on PES membrane materials and polypropylene structural components; notably, the PES resin determines the foundation for the membrane's hydrophilic modification, heat resistance, chemical resistance, and low protein-binding characteristics. Sterilizing-grade products demand significantly higher material consistency than standard industrial filters, as factors such as extractables, endotoxins, particle shedding, sterilizability, and batch-to-batch stability directly impact the quality control of pharmaceuticals, culture media, and high-purity fluids. Midstream processes encompass membrane fabrication, hydrophilization, pleating, thermal welding, end-cap sealing, and integrity testing. Characterized by excellent hydrophilicity, low protein adsorption, and high flow rates, sterilizing-grade PES pleated filter cartridges are extensively utilized in biopharmaceuticals, healthcare, and the food and beverage industry.

In 2025, global sales volume is projected to reach approximately 3 million units at an average price of around \$118 per unit, with major manufacturers achieving gross

margins in the range of 35% to 50%.
